(Due date: September 29th @ 5:30 pm)

Presentation and clarity are very important! Show your procedure!

PROBLEM 1 (28 PTS)

- a) What is the minimum number of bits required to represent: (2 pts)
- ✓ 341,000 symbols? $\lceil \log_2 341,000 \rceil = 19$
 - ✓ Symbols that represent numbers between 25,000 and 33,192? $\log_2(33192 - 25000 + 1) = 14$

- b) A microprocessor has a memory space of 4 MB. Each memory address occupies one byte. (8 pts)

- What is the address bus size (number of bits of the address) of this microprocessor?

Since 4 MB = 2^{22} bytes, the address bus size is 22 bits.

- What is the range (lowest to highest, in hexadecimal) of the memory space for this microprocessor?

With 22 bits, the address range is 0x000000 to 0x3FFFFFF.

- The figure to the right shows four memory chips that are placed in the given positions:
 - Complete the address ranges (lowest to highest, in hexadecimal) for each of the memory chips.

		Address	8 bits
00	0000 0000 0000 0000 0000 0000:	0x000000	1

01	0000 0000 0000 0000 0000 0001:	0x100001	
...	...		1MB
01	1111 1111 1111 1111 1111 1111:	0x1FFFFFF

- c) A microprocessor has a 32-bit address line. The size of the memory contents of each address is 8 bits. The memory space is defined as the collection of memory positions the processor can address. (6 pts)

- What is the address range (lowest to highest, in hexadecimal) of the memory space for this microprocessor? What is the size (in bytes, KB, or MB) of the memory space? 1KB = 2^{10} bytes, 1MB = 2^{20} bytes, 1GB = 2^{30} bytes

Address Range: 0x00000000 to 0xFFFFFFFF.

With 32 bits, we can address 2^{32} bytes, thus we have $2^{230} = 4GB$ of address space.

- A memory device is connected to the microprocessor. Based on the size of the memory, the microprocessor has assigned the addresses 0xA0400000 to 0xA07FFFFF to this memory device.

- What is the size (in bytes, KB, or MB) of this memory device?
- What is the minimum number of bits required to represent the addresses only for this memory device?

As per the figure, we only need 22 bits for the address in the given range (where the memory device is located). Thus, the size of the memory device is $2^{22} = 4\text{MB}$.

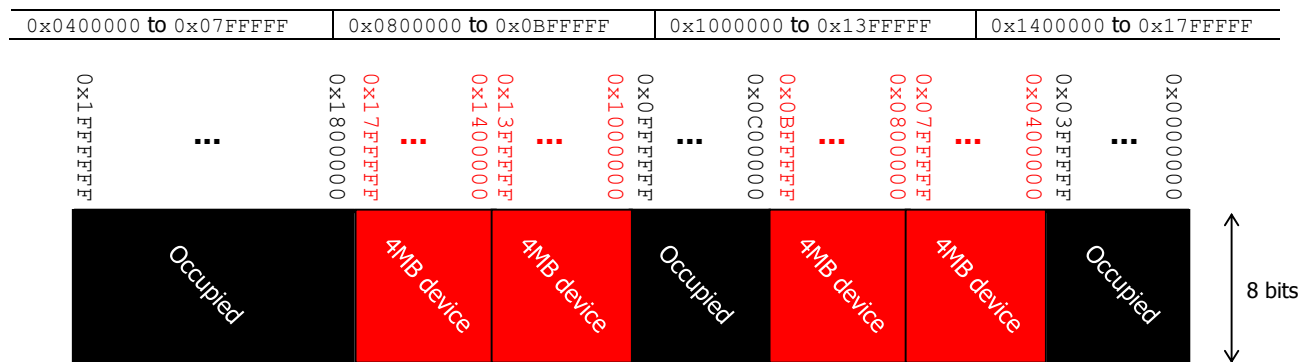

- d) The figure below depicts the entire memory space of a microprocessor. Each memory address occupies one byte. (12 pts)
- What is the size (in bytes, KB, or MB) of the memory space? What is the address bus size of the microprocessor?

Address space: $0x00000000$ to $0x1FFFFFFF$. To represent all these addresses, we require 25 bits. So, the address bus size of the microprocessor is 25 bits. The size of the memory space is then $2^{25} = 32\text{ MB}$.

- If we have a memory chip of 4MB, how many bits do we require to address 4MB of memory?

$4\text{MB} = 2^{22}$ bytes. Thus, we require 22 bits to address only the memory device.

- We want to connect the 4MB memory chip to the microprocessor. For optimal implementation, we must place those 4MB in an address range where every single address share some MSBs (e.g.: $0x1C000000$ to $0x1FFFFFFF$). Provide a list of all the possible address ranges that the 4MB memory chip can occupy. You can only use any of the non-occupied portions of the memory space as shown below.

PROBLEM 2 (32 PTS)

- In these problems, you MUST show your conversion procedure. **No procedure = zero points.**
- a) Convert the following decimal numbers to their 2's complement representations: binary and hexadecimal. (12 pts)
 - ✓ -511.625 , 101.3125 , -64.6875 , -31.65625 .
 - $+511.625 = 011111111.101 \rightarrow -511.625 = 100000000.011 = 0xE00.6$
 - $101.3125 = 01100101.0101 = 0x65.5$
 - $+64.6875 = 0100000.1011 \rightarrow -64.6875 = 111011111.0101 = 0xFBF.5$
 - $31.65625 = 011111.10101 \rightarrow -31.65625 = 10000.01011 = 0xE0.51$

b) We need to perform the following operations, where numbers are represented in 2's complement: (24 pts)

- ✓ $-87 + 256$
- ✓ $490 + 22$
- ✓ $-129 + 128$

- ✓ $-35 + 65$
- ✓ $-255 - 230$
- ✓ $986 + 123$

▪ For each case:

- ✓ Determine the minimum number of bits required to represent both summands. You might need to sign-extend one of the summands, since for proper summation, both summands must have the same number of bits.
- ✓ Perform the binary addition in 2's complement arithmetic. The result must have the same number of bits as the summands.
- ✓ Determine whether there is overflow by:
 - Using c_n, c_{n-1} (carries).
 - Performing the operation in the decimal system and checking whether the result is within the allowed range for n bits, where n is the minimum number of bits for the summands.
- ✓ If we want to avoid overflow, what is the minimum number of bits required to represent both the summands and the result?
