TIC-TAC-TOE

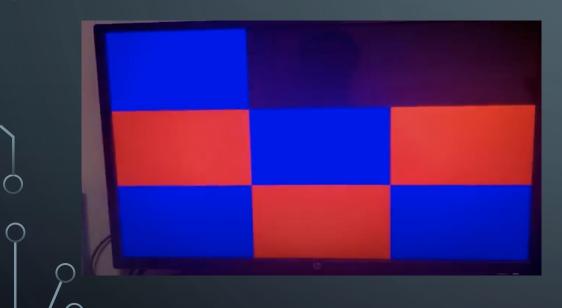

PROJECT COMPLETED BY:

ANGEL BAUTISTA, ANTONIO MONTAGNA, PAOLO NIKAJ AND IAN BETZ

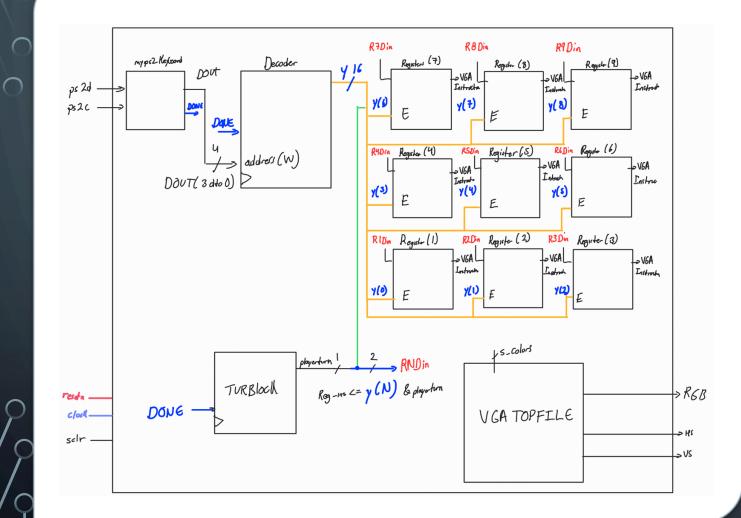

Agenda

 \cap

 \bigcirc

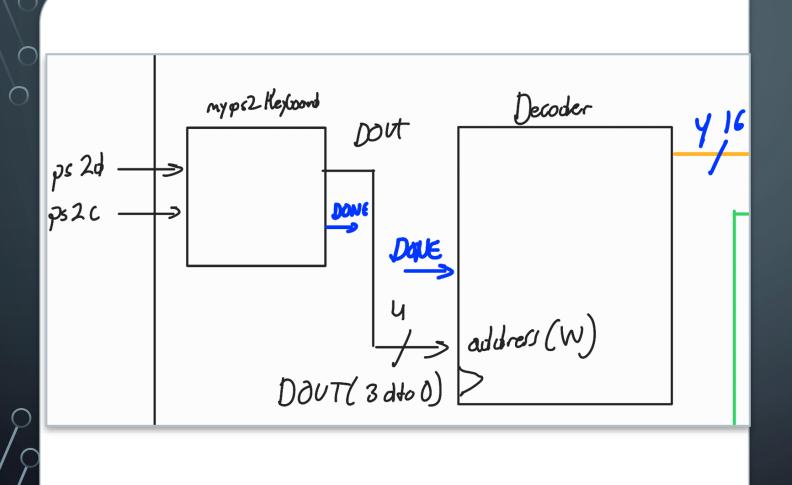

- Operation of a Tic Tac Toe game
- Circuit Components
 - PS2/Keyboard and Decoder
 - Memory
 - Game Logic
 - **FSM**
 - VGA display
- Hardware Implementation
 - Video Demo

TIC TAC TOE game

- The purpose of this project is to make a functional Tic Tac Toe game.
- Game data is saved on memory registers, these registers are enable by a decoder.
- The game logic is performed by the Turn
 Block Circuit as well as the decoder register.

PS/2 Keyboard/Decoder

 "myps2_keyboard" was implemented in this project

When a key is pressed

 a "Done" signal
 enable the decoder
 and game logic
 circuit.

PS/2 Keyboard/Decoder

• Each value from the keypad is mapped to a single enable bit.

Only 9 bits were used • out of 16 as enable register.

Only one enable line • is active per turn.

Game Registers

- 2-bit register with enable and reset.
- Sequential circuits that store the values of signals.
- 2 bit register that has a storage element that can hold 2 bits.
- The registers used in this Game go from R1 to R9.

Game Logic

• TurnBlock is a simple logic instruction that alternates a single bit every time a key is pressed on the keyboard. Reg_ins is a concatenation of the playerturn bit and the numpad output.

		MS	3	Block	K vs / Plo	yr					Block stat

status: Player 1 -> 0

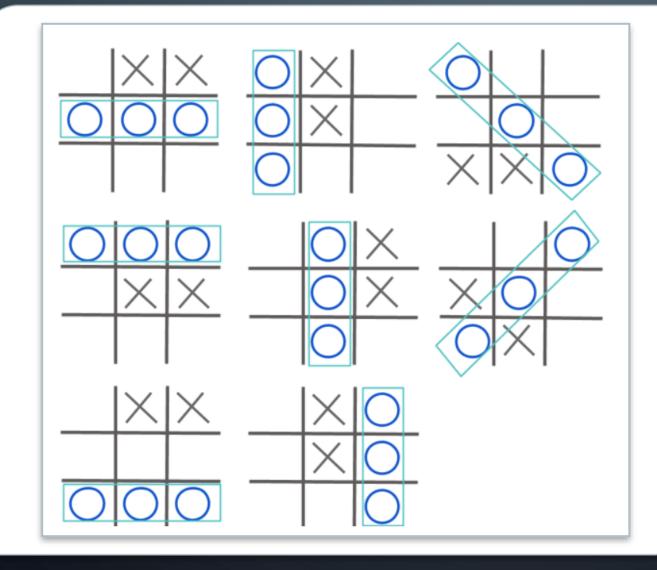

0

1 win

Player 2 -51

- An 18-bit binary value (VGAins) is used in order to track the game progress and instruct the VGA.
- This truth table shows the VGAins value during a sample gameplay.

 \mathcal{O}

Game Logic

- Winner is displayed on the built-in LEDs
- Right half LEDs-P1 WIN
- Left half LEDs-P2 WIN
- Detecting a winner is done with concatenating the corresponding signals for each combination along with the player turn bit.

Game Logic FSM

 \mathcal{O}

16 \cap

VGA

- The VGA topfile uses the inputted VGAINS value in order to determine what will be outputted to the display.
- S_colors block functions to decode the VGAINS value and determine when and where to display on the screen

٩	428 - 646	321-430

VGA

- The Display is divided into nine rectangles. each range will illuminate when selected. red for player 1 and blue for player 2.
- the VGA was mapped using
 HC values 0-640, and VC
 values 0-480 to properly fit
 our display.
